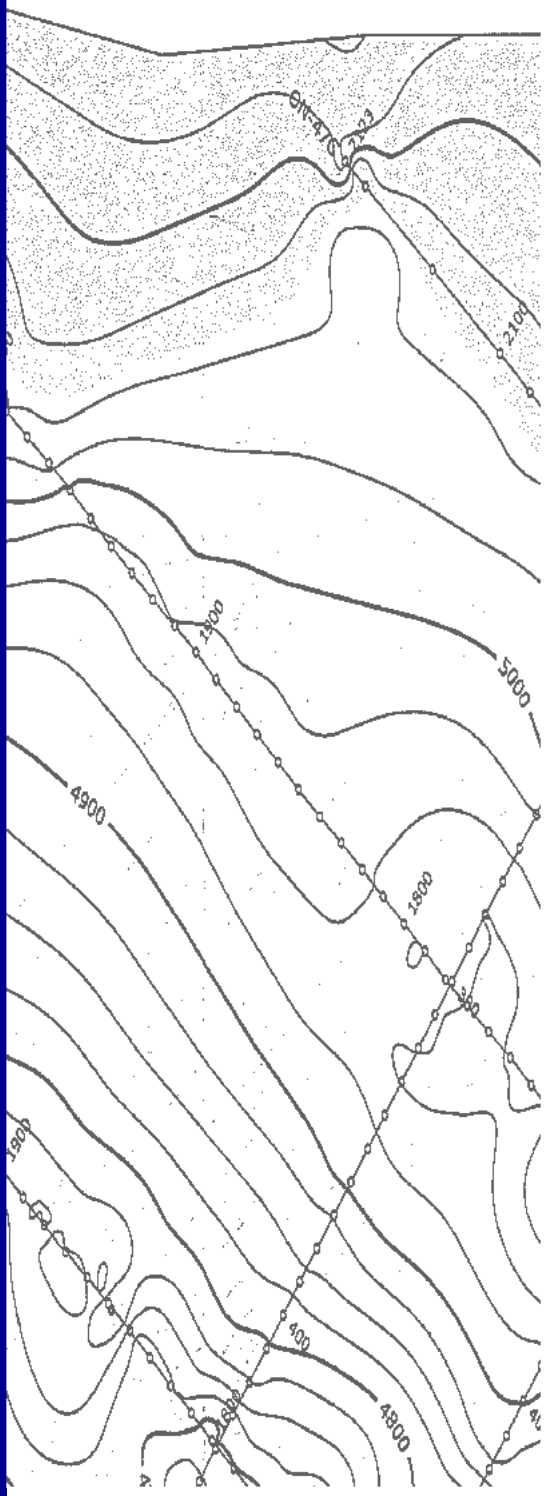
Target Geodata Ltd
first for data

ezVector Service



Target Geodata are experts in the conversion of hardcopy geotechnical data into modern digital formats.

Maps are scanned to high-resolution B & W, Greyscale or Colour. Target Geodata employs leading software to capture:

Contours
Faults
Fault polygons
Shotpoint maps

QC of the output data is enabled by overlaying the output data over the underlying, geo-referenced TIFF where any irregularities, misties or projection errors can easily be visualized and rectified if necessary. Where necessary, data from different sources can be integrated to create a rationalized geodetic project.
